PROJECT OVERVIEW

- The accumulation of non-recyclable waste around the world and the time it takes to biodegrade can affect in our lifestyle.
- There are mainly three reasons why waste accumulation is becoming an increasingly severe problem during the last 50 years.

PROJECT OVERVIEW (cont)

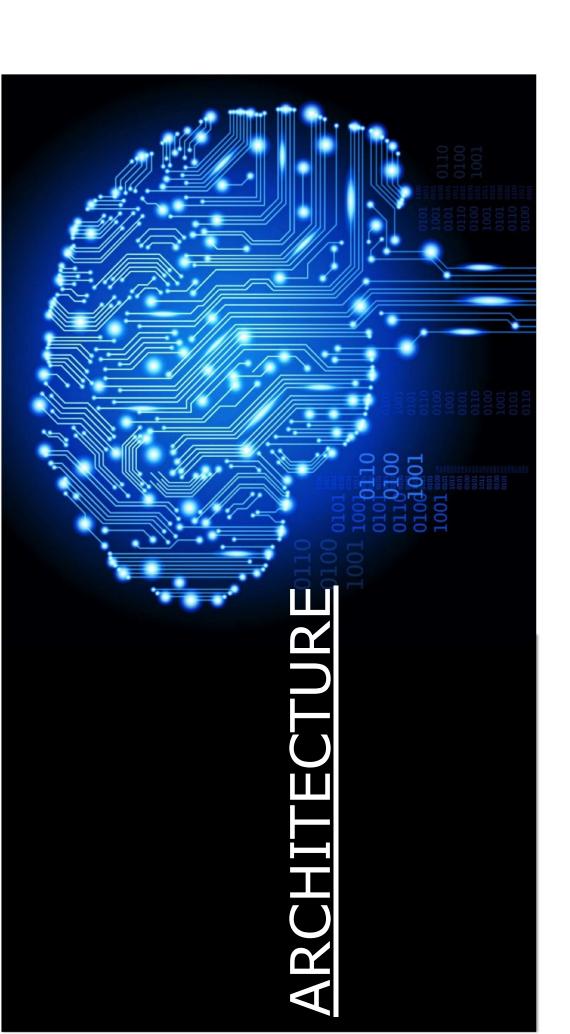

- overpopulation.
- The absence of recyclable items
- available on the market.
- The lack of use modern technologies in the recycling.

PROJECT OVERVIEW (cont)

ROLE OF MACHINE LEARNING IN THIS SCENARIO

OBJECTIVE

- environmental issues like waste accumulation, pollution based on deep learning techniques focused on solving The goal of this project is to develop an application
- between two different types of waste depending on the It is done by creating a model capable of sorting fabrication materials, thus its recyclability.
- The classification of the waste are based on PLASTIC, E-WASTE.

ARCHITECTURE

IMPLEMENTATION

IMPLEMENTATION

For this work, we are using a trash image dataset which was created by Gary Thung and Mindy This is a small dataset and consist of 2031 images, which is divided into two different classes plastic been resized down to 224 x 224. Few samples of and e-waste, all the pictures of the images have the images are shown in Fig. 2

SOURCECODE

```
from tensorflow.keras.applications.vgg19 import VGG19
```

```
base_model = VGG19(input_shape = (224, 224, 3), # Shape of our images
                                                                     include_top = False, # Leave out the last fully connected layer
                                                                                                                                      weights = 'imagenet')
```

Fig.3 Instantiates the VGG19 architecture.

SOURCE CODE (cont)

```
model.compile(optimizer = tf.keras.optimizers.RMSprop(lr=0.0001), loss = 'binary_crossentropy',metrics = ['acc'])
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              x to be equal to the pretrained models outputs (after applying an additional dense layer).
                                                                                                                                                                                                                                                                                                                                                                               Add a fully connected layer with 224 hidden units and ReLU activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          model = tf.keras.models.Model(base_model.input, x)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    # Add a final sigmoid layer for classification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          x = layers.Dense(1, activation='sigmoid')(x)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           = layers.Dense(224, activation='relu')(x)
                                                                                                                                                                                                                                                                         Flatten the output layer to 1 dimension
                                                                                                                                                                                                                                                                                                                        = layers.Flatten()(base_model.output)
